

Hallucinogenic

This describes a drug which alters perception...

...the way you see, hear, feel, smell or touch the world. This can mean that the senses can get all mixed up or changed. People may see colours much more brightly or hear sounds differently, or say that they can hear colours and see sounds - known as synaesthesia.

They might also see things that aren't there and this can be very frightening for some people. [LSD](#) and [magic mushrooms](#) and the strongest types of [cannabis](#) are hallucinogenic, as is [DMT](#) and to an extent [ecstasy](#).

See also [psychedelic](#).
